## Connectivity ReachForce Continuous DataManager

Scribe Connectors provide the Scribe platform with three main types of access to applications – connect access, metadata access, and logic access – without any modifications. The ReachForce Connector provides the following:

### CONNECT ACCESS

Connect access provides the platform with the connection through which it will acquire metadata and execute application logic.

- Each connection to ReachForce provides access to application through a user name and password which is provided by ReachForce.
- The Connector automatically manages the ReachForce access credentials so that the connection is maintained. There is no need to refresh the token.

### METADATA ACCESS

Once connected, the platform obtains the metadata necessary to populate the design interface with available entities and their fields along with supported operations. The design interface is used to configure business logic, data queries, and data transformations.

- ReachForce templates are used to execute operations.
- Field data types and lengths are presented for ease of field mapping research.
- User accessible ReachForce metadata options offers users customized results for their needs.

### LOGIC ACCESS

After a map or set of maps is configured, executing or debugging the map uses the connection to execute the logic configured in the map.

- The Connector packages up data to be sent to ReachForce via API calls.
- The Connector provides data returned by API calls to the platform for use in later steps.
- The Connector also returns any error messages supplied by the API back to the platform to enable custom error handling.

All of this functionality is accessible within the intuitive Scribe Online platform user interface.

### Add powerful contact lead data management to your integrations.

Adding contact data management and validation in-line to your integrations is as easy as adding and configuring a block in your maps. Creating a custom web service validates and cleans company lead data with a simple call from your applications in a seamless user interface experience in Scribe Online.
